

Medical Reference: Asthma and Hypertension (Sample)

ASTHMA

Asthma is a chronic respiratory condition characterized by inflammation and narrowing of the airways. Common causes include genetic predisposition, environmental allergens (pollen, dust mites), air pollution, respiratory infections, and occupational irritants.

Symptoms include wheezing, shortness of breath, chest tightness, and coughing.

Management includes inhaled bronchodilators, corticosteroids, and trigger avoidance.

HYPERTENSION

Hypertension (high blood pressure) is defined as sustained blood pressure at or above 140/90 mmHg. Primary causes include genetics, high sodium intake, obesity, sedentary lifestyle, chronic stress, and excessive alcohol use. Secondary hypertension may result from kidney disease, endocrine disorders, or certain medications.

Treatment includes lifestyle modification, ACE inhibitors, ARBs, diuretics, and regular monitoring.

DIABETES TYPE 2

Type 2 diabetes involves insulin resistance and relative insulin deficiency. Risk factors include obesity, family history, physical inactivity, and age over 45. Complications can affect cardiovascular, renal, and nervous systems. First-line management includes metformin, diet, and exercise.
